

JAVA STRING OPERATIONS

length() – Returns the total number of characters in a string.

Syntax: `string.length();`

charAt() – Returns the character at a specified index.

Syntax: `string.charAt(index);`

concat() – Joins two strings together.

Syntax: `string1.concat(string2);`

toUpperCase() – Converts the string into uppercase letters.

Syntax: `string.toUpperCase();`

toLowerCase() – Converts the string into lowercase letters.

Syntax: `string.toLowerCase();`

equals() – Compares two strings and is case-sensitive.

Syntax: `string1.equals(string2);`

equalsIgnoreCase() – Compares two strings without considering case.

Syntax: `string1.equalsIgnoreCase(string2);`

substring() – Extracts a part of the string from the given index to the end.

Syntax: `string.substring(start);`

substring(start,end) – Extracts characters from start index to end index (end not included).

Syntax: `string.substring(start, end);`

contains() – Checks whether the specified character or string is present.

Syntax: `string.contains("value");`

indexOf() – Returns the index of the first occurrence of a character or string.

Syntax: `string.indexOf("value");`

replace() – Replaces specified characters or text with new characters or text.

Syntax: `string.replace(old, new);`

trim() – Removes spaces from the beginning and end of the string.

Syntax: `string.trim();`

startsWith() – Checks whether the string starts with the specified characters.

Syntax: `string.startsWith("value");`

endsWith() – Checks whether the string ends with the specified characters.

Syntax: `string.endsWith("value");`
